EXPERIMENT 13
Enterprise limitations case study

Aim

Analyze where the low code design may fall short for a large multi-campus admission network and propose an architecture.

Procedure

1. Hypothetical scenario (assumptions, not measured limits): 25 campuses, 500,000 historical enquiries, mobile counsellor apps, central identity, seat transfers between campuses, peak load on results day.
2. Turn it into acceptance targets: response time, downtime, data residency, audit retention, concurrent seat allocation, offline behaviour, recovery time.
3. Map each requirement to a native capability, extension, or unresolved constraint; check current quotas, API limits and licensing.
4. Design proof-of-concept tests: concurrent seat allocation, peak dashboard load, delayed sync, identity revocation.
5. Compare all-Creator, hybrid and custom with weighted criteria; write a recommendation and exit strategy.

Implementation and verification

Risk	Consequence	Mitigation to evaluate
Concurrent seat allocation	Two students admitted to the last seat	Single authoritative allocation service
Offline mobile use	Stale status	Online-only final status or reconciliation rules
Large reporting load	Slow pages, quota hit	Pagination, archival, measured queries
Cross-service updates	Creator and CRM state differ	Idempotency keys, retries, reconciliation
Vendor dependency	Cost / portability	Export drills, contract review

Proposed acceptance targets (assumptions to be agreed with stakeholders; not platform limits):

Requirement	Proposed target	Mapping
Dashboard response (peak)	Under 3 seconds for typical views	Test in PoC; unresolved until measured
Seat allocation	No seat sold twice	Extension: allocation service
Recovery time	Within 4 hours	Backup/restore drill (Exp. 12)
Audit retention	Per institution policy	Check plan retention; export if short
Identity	Central sign-in, instant revocation	Check supported SSO options
Offline	Online-only final status	Design decision

Weighted comparison (weights fixed before scoring; scores are estimates under the stated assumptions):

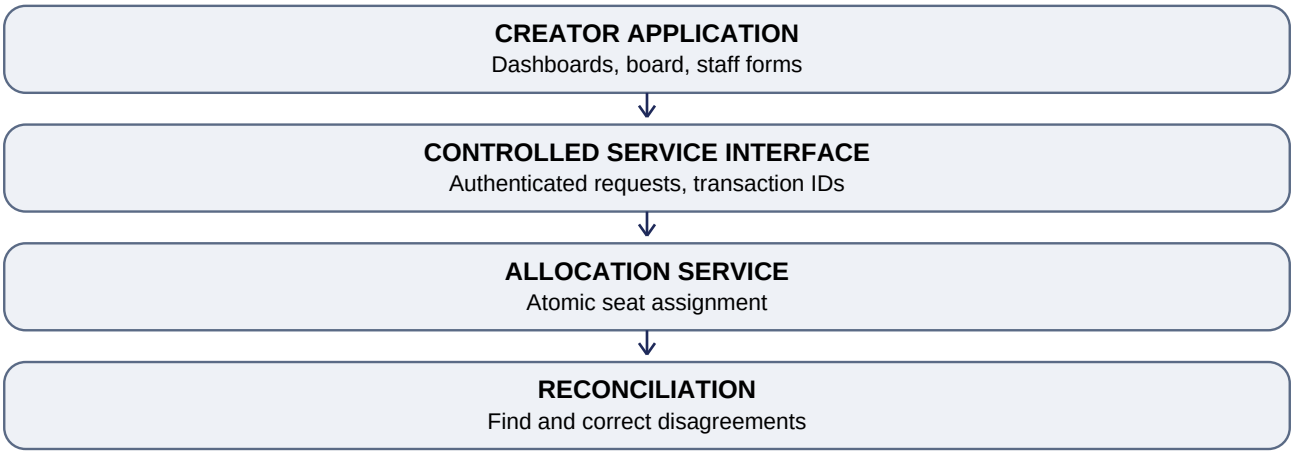
Criterion	Weight %	All-Creator	Hybrid	Custom
Concurrency control	25	2	4	5
Time to deliver	20	5	4	1
Scale and reporting	20	3	4	5
Governance and identity	15	3	4	4
Cost	10	4	3	1
Portability	10	2	3	5
Weighted total (of 5)	100	**3.15**	**3.80**	**3.65**

Recommendation (conditional on the assumptions): keep Creator for staff forms, boards and dashboards, and add a controlled allocation service for seats. Exit strategy: scheduled data exports, documented business rules, periodic restore drill.

Evidence and testing

E13: acceptance targets, risk register, recommendation with stated assumptions.

Process diagram



Generated explanatory diagram. It is not a screenshot of an executed workflow.

Result

Expected result and verification criteria. A defensible recommendation with explicit assumptions; no unsupported claim that low code cannot scale or that it meets every enterprise need.
